Custom Computers Are Worth It

In the 21st century, computers have become part of everyone's daily lives. The 2020 pandemic has made computers even more of a necessity. Programs have become increasingly hard to operate as hardware has increased in power. to meet the harsh demands of modern software, it is best to get a custom computer.

In 2020, the computer market has skyrocketed. Computers are a need instead of a want because of covid 19. shipments of computers have increased by 14 percent over the last year 2019. there was a 90 percent increase in sales for Chromebooks. Computer parts are becoming more scarce because of the pandemic. It is virtually impossible to find recently launched hardware. Due to coronavirus, China has been shutting down memory chip factories, Craig Yeung states.

Everybody has to work at home. Brand new software is needed for people to do the same jobs they did outside of the house. New software needs more powerful hardware to run effectively. the general rule of thumb is to upgrade your computer every five years. People are buying brand new computers so they can work at home, but they are very costly nowadays.

Do not buy a pre-built desktop computer. Buy a laptop or build a computer yourself. Laptops are generally more expensive than their desktop equivalent. A $1000 laptop will perform as well as a $500 custom desktop. Building a desktop computer yourself will save you hundreds of dollars. OEM companies charge you hundreds of dollars to build a computer for you. Plus, the build quality is generally terrible, which can cause performance issues.

Used computers offer much more value than brand new computers. Brand new components are much more expensive. Used components can be found for much less than new

parts. Most programs don't need the best, most modern computer to run well. High-end Parts from 2013 can perform just as well as new middle-of-the-road parts today.

More computers should be recycled. People threw out 41.8 tons of e-waste in 2014. If we refurbished all of the computers thrown out, More people could get a job and more kids could get an education. I have seen dozens of very capable computers sent to a precious metals recycler. A working capable computer is worth more than the precious metals inside of it especially if it is a student using it.

The demand for computers is insanely high these days, More people than ever before need computers. Brand new pre-built computers are overpriced. Custom built computers have much better value. Recycling computers is very important and can help anybody afford a capable computer.
